

ASSIGNMENT 1

Workflow & Agent Integration in Your Practice

Design the same process two ways — as a predictable workflow and as a dynamic AI agent — then compare when each approach makes sense.

What You'll Do

Take a real process from your role, project, or department and explore how it behaves under two different automation paradigms.

1

Pick a Process

Choose a common, repeatable task from your actual work — something you know well enough to map step by step.

2

Design Two Versions

Model it first as a fixed workflow, then reimagine it as an LLM-powered agent with dynamic decision-making.

3

Compare & Justify

Explain when you'd choose a predictable workflow vs. a flexible agent — and why the distinction matters.

APPROACH 1

Design It as a Workflow

A **workflow** follows fixed, predictable steps in a set order. Every execution follows the same path — ideal for structured, repeatable tasks.

Step 1 → Step 2 → Step 3

Each step triggers the next automatically. No deviation, no interpretation.

Best For

Approval chains, data pipelines, scheduled reports, compliance checks.

APPROACH 2

Design It as an Agent

Dynamic Decision-Making

An **AI agent** uses an LLM to assess the situation and choose tools on the fly — no fixed path required.

"Based on situation X, I'll use tools Y and Z."

Best For

Customer support triage, research synthesis, adaptive routing, ambiguous inputs.

Compare, Submit & Deliver

Workflow

Use when steps are **known, stable, and rule-based**. Low risk, high consistency.

Agent

Use when inputs are **variable, ambiguous, or context-dependent**. Flexibility over predictability.

i Deliverables: Upload a **PPT with diagrams and explanations** showing both designs side by side. Also submit your **public GitHub link** — ensure repository access is open before submitting.
